1.0 Overview

This document describes the Transaction Notification Service (TNS) offered by Zego (Powered by PayLease) to provide transaction confirmation to a partner's service end point after their users access Zego's online payment system to make a payment.

Ease of use for our clients is our main goal. The TNS provides an end-to-end solution when users make payments via Zego by returning transaction information to the partner.

2.0 Specification

The first step in utilizing the Zego Transaction Notification Service is to create two (2) end points (or "listening services") within the partner application. These will be custom URLs and might look like the following:

<https://YourWebsite.com/YourProcessedEndPoint>

<https://YourWebsite.com/YourCanceledEndPoint>

The Zego system will automatically send transaction information (in near real time) via HTTP POST to these URLs after payments have been processed or canceled (including NSF transactions).

2.1 POST Parameters

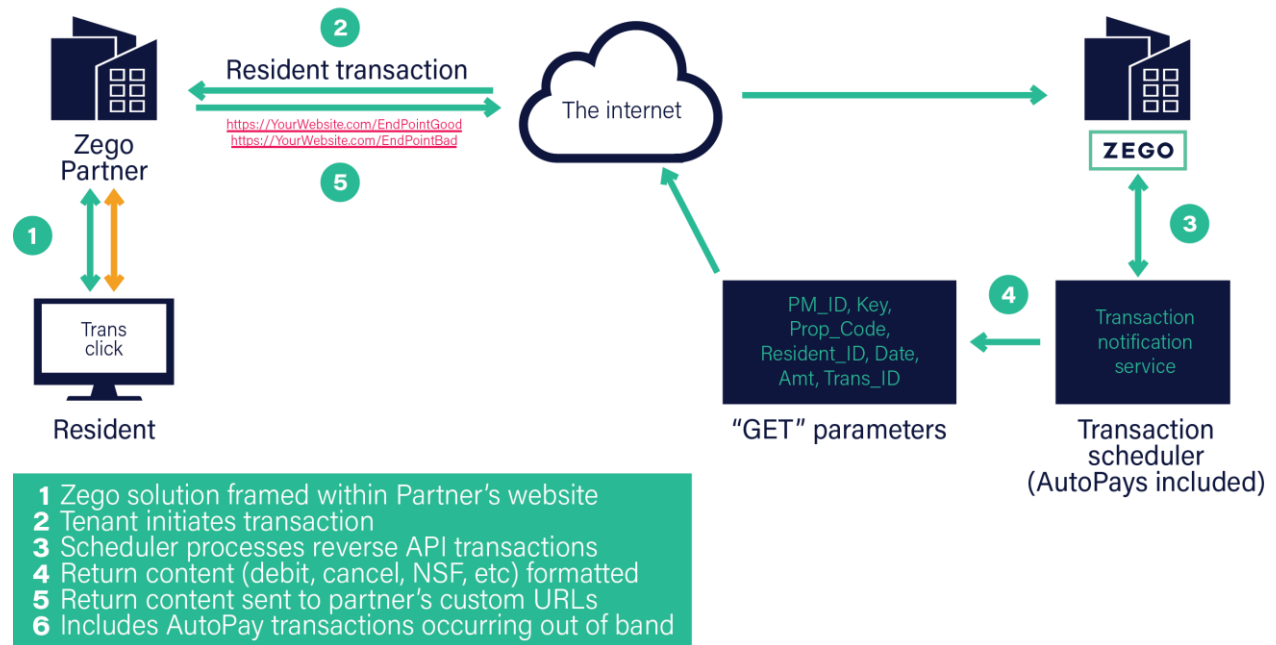

The following parameters will be sent to both URLs:

- pm_id (Zego provided)
- key (Zego provided)
- PropertyCode (from PM company)
- ResidentID (from PM company)
- TDate (transaction initiation date of the form "YYYY-MM-DD HH:MM:SS")
- TAmount (transaction amount)
- PayLeaseTransactionID

2.2 Example

The following example illustrates how the Transaction Notification Service would function in an end-to-end environment:

Transaction Notification Service
